Ilya Isaev

Senior Frontend Developer with **8+ years of experience in React and TypeScript**. Built web applications for two of Russia's largest banks and the country's largest children's goods retailer. In my latest role, I owned the frontend of a SaaS platform for research labs end to end: built it from scratch and shipped it to production.

Key competencies: frontend architecture, data-heavy and real-time interfaces, performance optimization, legacy system modernization, automated testing, AI-assisted development, mentoring.

Skills

- *Core stack:* React, TypeScript, JavaScript, Feature-Sliced Design (FSD), React Router, TanStack Router
- *State and data:* Effector, TanStack Query (React Query), Redux Toolkit (RTK Query), Redux (Thunk, Saga), MobX
- *Forms and API:* React Hook Form, Formik, Zod, OpenAPI (openapi-typescript, Kubb), WebSockets
- *Tables and visualization:* AG Grid, React Data Grid, TanStack Virtual, Canvas API, Recharts, Monaco Editor
- *UI and styling:* MUI, Ant Design, Mantine, shadcn/ui, Tailwind CSS, Styled Components, SASS, Storybook, Figma
- *AI:* Claude Code, Cursor, agent rules and context tailored to the project architecture
- *Testing:* Playwright, Vitest, Cypress, Jest, React Testing Library
- *Backend, build, and DevOps:* Node.js, Koa.js (BFF), Webpack, Docker, GitLab CI/CD, Sentry

Experience

Senior Frontend Developer April 2024 – June 2026

Balthazar Labs · Amsterdam-based deep tech SaaS startup · 2 years 3 months · balthazar.app · Remote, contract

SaaS platform for research labs in deep tech industries (semiconductors, photonics, quantum technologies, etc.): tracking of experiments, prototypes and results, real-time dashboards, Python scripting.

Stack: React, TypeScript, Effector, Feature-Sliced Design, TanStack Query, TanStack Virtual, TanStack Router, React Hook Form, Zod, Kubb, AG Grid, WebSockets, Monaco Editor, Keycloak, Playwright, Vitest

- Designed an architecture based on Feature-Sliced Design and developed the platform frontend from scratch through to production. Owned the frontend end to end: made technical decisions, planned and estimated work, and aligned API contracts with the backend team.
- Built server data handling on TanStack Query (caching, optimistic updates) and client business logic on Effector. Made the OpenAPI specification the single source of truth for the backend contract: requests are typed via openapi-typescript and openapi-react-query, and Kubb generates TypeScript types, Zod schemas for validating server responses and React Hook Form forms, and test data with Faker.
- Developed AG Grid interfaces for experiment management and results analysis, and implemented real-time updates of data, threaded comments and charts over WebSockets. Rendered data-heavy charts with the Canvas API to avoid the DOM overhead of SVG.
- Embedded a Python code editor built on Monaco Editor, with execution of user scripts and log streaming over WebSockets. Implemented a custom file tree for the connected Git repository: lazy folder loading, virtualization with TanStack Virtual for large repositories, and file and folder operations.
- Ensured responsiveness on low-end devices and slow connections: built all data feeds, including high-volume logs, on TanStack Virtual with server-side pagination; route-based code splitting and lazy loading of heavy modules (React.lazy, Suspense) reduced the JavaScript loaded at startup.
- Set up automated testing: Playwright for e2e, Vitest for unit tests, and Docker for identical environments locally and in CI. Set up production error monitoring with Sentry.
- Formalized architectural rules for AI agents (FSD, Effector, TypeScript) and introduced AI-agent workflows for routine tasks: developing new features within the FSD architecture, refactoring, and writing tests.

Senior Frontend Developer October 2020 – March 2024

Detsky Mir · Russia's largest children's goods retailer · 3 years 6 months · detmir.ru · Moscow

Supplier portal of the Detsky Mir marketplace: management of products, supplies and settlements, electronic document workflow with e-signatures.

Stack: TypeScript, React, Redux Toolkit, RTK Query, React Router, MUI, Styled Components, Storybook, Koa.js, Cypress, Jest, React Testing Library, Webpack, GitLab CI/CD

- Developed a React and Redux Toolkit SPA in a team of 10 frontend developers; helped new developers onboard onto the project.
- Built portal sections: creating and editing product cards with variants and sizes, managing prices, supplies and stock, and analytics reports for suppliers.
- Owned the migration of the state layer from Redux and Redux Thunk to Redux Toolkit and RTK Query, which eliminated reducer boilerplate and manual data-fetching logic.
- Developed the internal component library based on MUI with a Storybook catalog: built complex table and form components and customized the theme to the design system, so new portal sections could be assembled from ready-made blocks.
- Developed a BFF on Koa.js that aggregated data from several backend services and proxied authentication, reducing the number of client requests and simplifying client logic.
- Covered key scenarios with Cypress e2e tests and components with Jest and React Testing Library unit tests; set up GitLab CI/CD and refactored the Webpack configuration to optimize the build.

Frontend Developer December 2017 – September 2020

EPAM Systems · global IT services company · 2 years 10 months · epam.com

Outsourced development of internal systems for Sberbank and VTB used to manage banking processes.

Stack: JavaScript, TypeScript, React, Redux (Thunk, Saga), MobX, Formik, React Data Grid, Recharts, Jest, Enzyme, Ant Design, SASS

- Worked on three internal portals: built one from scratch with React, MobX and TypeScript (team of 5 frontend developers), migrated a legacy app from scalajs-react to React and Redux (2 developers), and evolved a large VTB portal on React and Redux (20 developers).
- Built a dynamic form engine that rendered forms from a backend JSON schema: field structure, validation and field dependencies were defined on the server, so forms could change without involving frontend developers.
- Built data-heavy interfaces: React Data Grid tables with virtual scrolling, lazy loading, compound filters, and Excel/CSV import and export; operational analytics with Recharts.
- Implemented multi-step approval workflows and role-based access control in the UI: availability of sections, actions and fields depended on user permissions.
- Mentored junior developers: conducted code reviews and helped them onboard onto the project.

Education

Peoples' Friendship University of Russia (RUDN), Moscow
Faculty of Physics, Mathematics and Natural Sciences, Applied Mathematics (incomplete), 2010

Languages

Russian — native
English — B2 (upper-intermediate)
